CHEAT SHEET

Git, the commands of a working week

What each does, in the order a change goes through them.

Start

- `git switch main` — Go to the main branch
- `git pull --rebase` — Bring it up to date, your commits replayed on top
- `git switch -c fix/total` — Start a branch for one change

Look

- `git status` — What changed and what is staged
- `git diff` — The changes not yet staged
- `git diff --staged` — The changes the next commit holds
- `git log --oneline -10` — The last ten commits, one line each

Commit

- `git add -p` — Stage a change hunk by hunk, saying yes or no to each
- `git commit` — Commit what is staged; the editor opens for the message
- `git commit --amend --no-edit` — Add what is staged to the last commit; only before it is pushed

Share

- `git push -u origin HEAD` — Push the branch and track it
- `git push --force-with-lease` — Push a rewritten branch unless someone else pushed to it

Undo

- `git restore file` — Throw away a file's unstaged changes
- `git restore --staged file` — Unstage it and keep the changes
- `git revert abc123` — A new commit that undoes abc123

Never rewrite a branch others have pulled: revert instead.

Branch tidy-up

- `git branch -d fix/total` — Delete a merged branch
- `git fetch --prune` — Forget branches deleted on the server

```
# every local branch already merged into main
git branch --merged main
```
